1 Introduction and Problem Analysis

1.1 The Missing Fabric Information

Secondhand clothing is becoming a substantial retail market. ThredUp's 2026 Resale Report, based on research by GlobalData, projects the global secondhand apparel market to reach US$393 billion by 2030 (ThredUp, 2026). As more garments are discovered online, buyers need useful information about individual items before they can touch them. The opportunity extends beyond finding more stock: each listing must help a buyer understand what that particular garment will be like.

A blouse can look right online while leaving a buyer unsure whether its fabric suits them. The photograph shows colour and shape, but gives less information about stretch, drape and movement. Research on clothing e-commerce connects this difficulty with the absence of tactile information (Wilfling et al., 2023). For secondhand merchants selling individual garments, explaining these differences is part of every purchase conversation.

ReFeel gives that conversation a familiar reference for later online purchases. The merchant records guided photographs and short clips, while the buyer selects a garment they already own. ReFeel presents observable differences alongside the supporting captures. Descriptions such as stretchy or fluid become easier to interpret when the buyer can relate them to something familiar. This approach builds on research supporting consistent visual demonstrations and clear fabric descriptions (Jang & Ha, 2023).

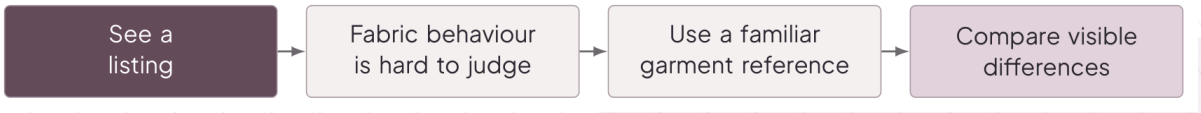

Figure 1. Where ReFeel supports a purchase decision

1.2 What Clothing Reviews Reveal

Our analysis draws on 290,697 eligible review bodies from Women's E-Commerce Clothing Reviews, ModCloth and Rent the Runway (Nicapotato, n.d.; Misra et al., 2018). Detected fabric-property language appears in 39.7%, 28.1% and 24.9% of the respective sources. Buyers repeatedly discuss the characteristics that a listing needs to communicate.

In the Women's data, reviews with detected fabric expectation differences have a 69.2% recommendation rate, compared with 82.0% for other reviews. Here, mismatch means language comparing a fabric property with what the reviewer expected, including favourable surprises. The 12.8-percentage-point gap shows why fabric expectations deserve attention: differences between expectation and experience accompany weaker recommendations. The evidence supports a real information problem and a commercial reason to explain fabric more clearly before purchase. Appendix 2 and Appendix 3 provide definitions, samples and detailed results.

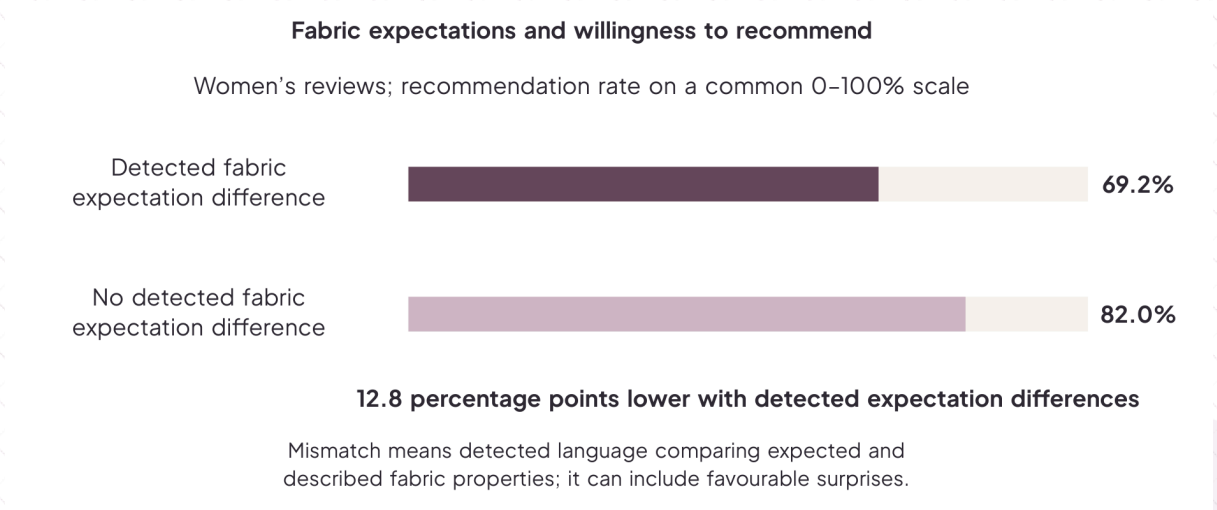

Figure 2. Fabric expectation differences accompany lower recommendation rates

1.3 ReFeel's Commercial Opportunity

The opportunity lies between discovering a secondhand listing and deciding whether to buy it. Merchants already attract buyers through social channels and marketplaces, but a photograph and a material name leave important questions unanswered. Lightweight tops provide a focused starting category in which clearer descriptions of movement, visible stretch and sheen can help buyers interpret individual garments.

A reusable layer of fabric evidence can serve recurring merchant enquiries and remain useful across sales channels. This creates an opportunity to charge merchants for information they can publish and share, while letting buyers compare for free. ReFeel can build its initial business around these repeat listing needs before extending the service to retailer catalogues.

2 Business Overview and Business Model

2.1 The Business in Brief

ReFeel is a merchant-paid service that helps buyers judge secondhand clothing by comparing a listing with a garment they already own. A merchant records guided photographs and short movement clips for each item. ReFeel converts them into a reusable garment profile that describes observable behaviour such as drape, visible stretch and recovery, surface sheen and show-through, and links every statement to the capture that supports it. The buyer saves a familiar garment as a private reference and sees the differences between the two, together with any property the captures cannot support.

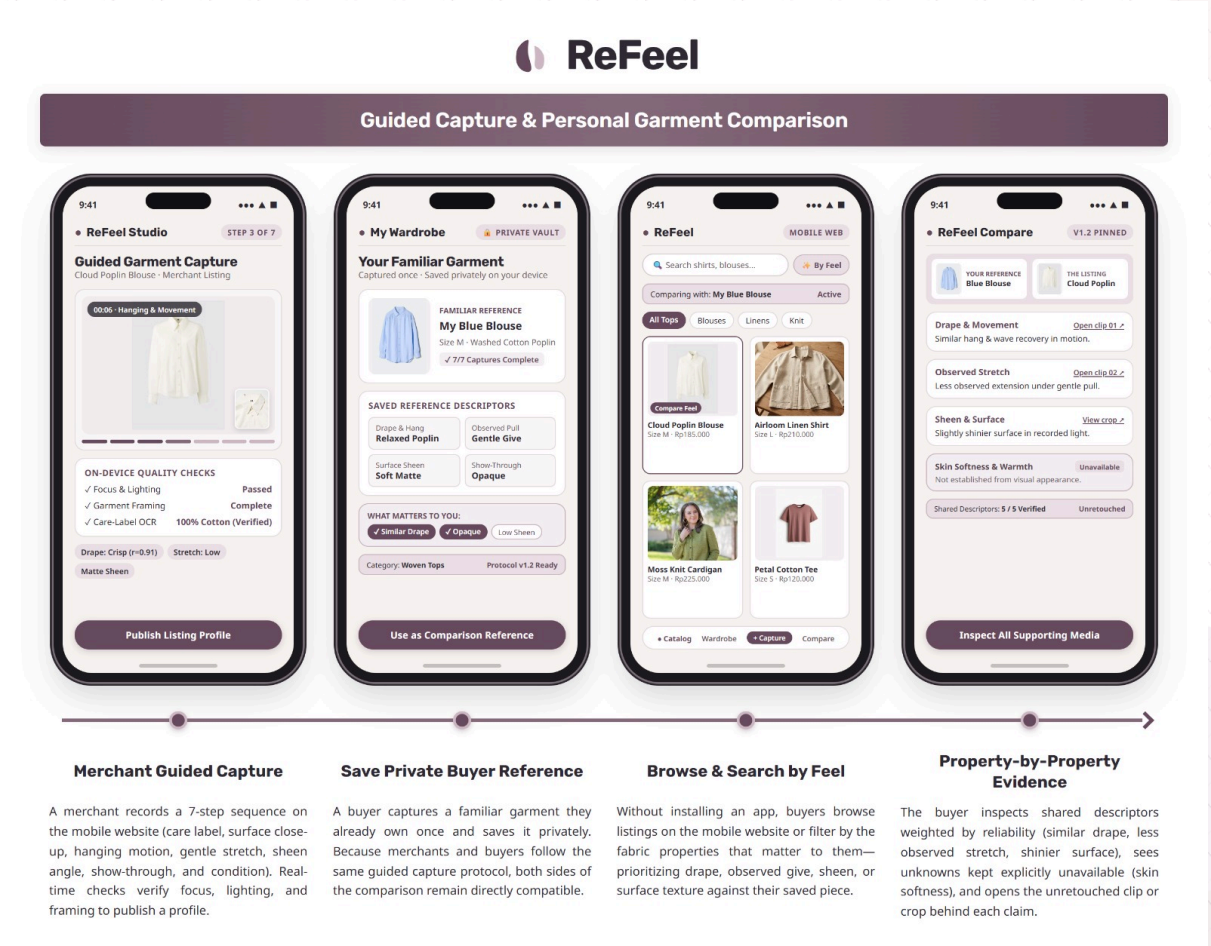

Figure 3. Guided capture and personal garment comparison

2.2 Customers and Value Proposition

Merchants are the paying customers. The first group is curated secondhand merchants and independent sellers in Jabodetabek who regularly list lightweight tops priced at roughly Rp100,000 to Rp250,000 and already answer the same fabric questions in every conversation. A published profile saves that repeated explanation, travels with the listing link on Instagram, TikTok, WhatsApp or a marketplace, and gives buyers evidence rather than adjectives such as soft or flowy.

Buyers are the second customer group, mainly students and young adults who shop for secondhand tops online. They compare for free, keep their reference garments private and can delete them. Their benefit is a clearer expectation before paying for a single, unrepeatable item. From January 2029, external retailers and resale platforms become a third customer group, adding the comparison to their own catalogues through a widget or API.

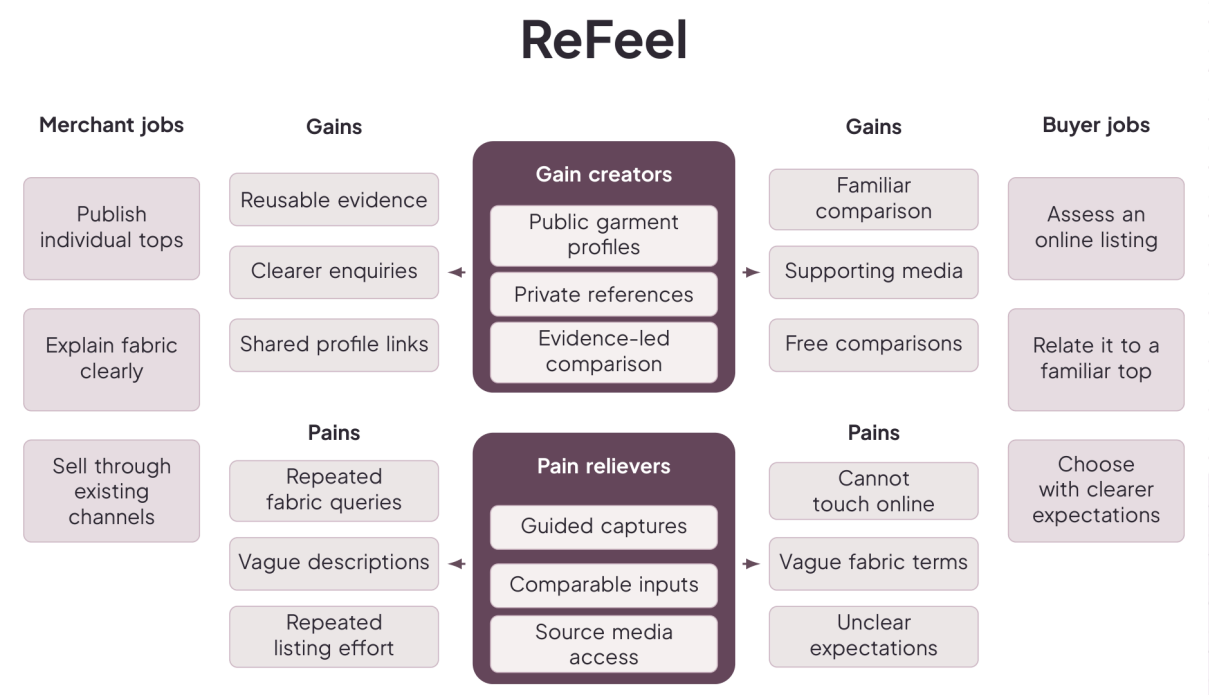

Figure 4. Merchant and buyer value proposition canvas

2.3 How ReFeel Earns Revenue

The model has three layers, each billed to the party that receives the value. Merchants pay Rp2,000 for each published profile, or subscribe to Pro at Rp199,000 per month, which includes 100 profiles and charges Rp2,000 for each additional one. Buyers pay an administration fee of 3% of the item subtotal, capped at Rp7,500 per order and excluding shipping, only when they complete a successful purchase through ReFeel checkout. Viewing profiles and comparing garments are free.

External businesses pay Rp1.5 million per month for a subscription that includes 1,000 processing jobs, with further jobs at Rp1,500 each, plus a one-time integration fee of Rp3 million for each new customer. This stream starts in 2029 and serves a separate customer group from the marketplace sellers. Merchandise value belongs to the merchants and is not counted as ReFeel revenue. Sales that a shared profile helps close on another channel do not generate administration fees. The Q3 2027 launch introduces this pricing structure, with detailed estimates in Appendix 7, while and Appendix 7 sets out the full pricing and billing rules. The profile earns its value through repeated use in listings and enquiries. Repeat publishing and Pro renewal sustain the merchant service, while ReFeel checkout adds administration income when a buyer chooses that purchase route.

Figure 5. Pricing follows the customer and the service used

2.4 Resources, Partners and Cost Structure

ReFeel's key resources include its capture protocol, profile and evidence store, comparison logic, and merchant relationships. Operations will begin with a lean founder-led team, adding contractors and support as demand grows. Target partners include preloved merchants, textile specialists, payment and logistics providers, and fashion and campus communities. Partnerships will be arranged during implementation. Costs comprise variable expenses (cloud processing, payment fees, merchant payouts, order support, and integrations), fixed expenses (team, contractors, operations, quality review, administration, and infrastructure), and marketing allocated by customer group. Chapter 7 and Appendix 7 detail the financial plan.

3 Product and Technology

3.1 Service Overview

ReFeel runs as a mobile website so that merchants and buyers need not install an application. The service has three steps. A merchant captures a garment and receives a published profile. A buyer captures a familiar garment once and saves it privately. The buyer then opens any listing profile and sees a property-by-property comparison with the supporting media. Merchants and buyers use the same guided capture, which keeps the two sides of a comparison compatible. Appendix 10.1 shows the mobile screens.

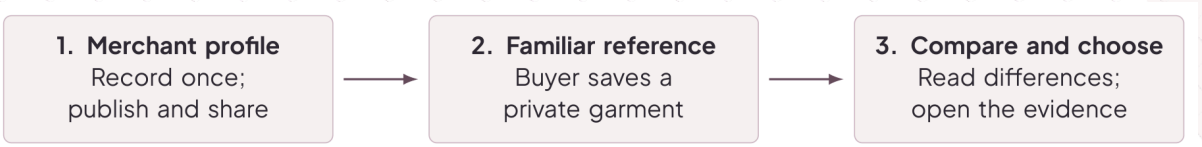

Figure 6. One merchant profile and one familiar reference support the buying decision

3.2 Guided Capture and Analysis

Each capture follows a short sequence: a care-label photograph, a surface close-up, a hanging and movement clip, a gentle stretch-and-release clip, an angle change to show sheen, a show-through view and close-ups of visible condition. The mobile page checks focus, lighting, framing and completeness while the person is still recording, and asks for a repeat of any clip that cannot support analysis.

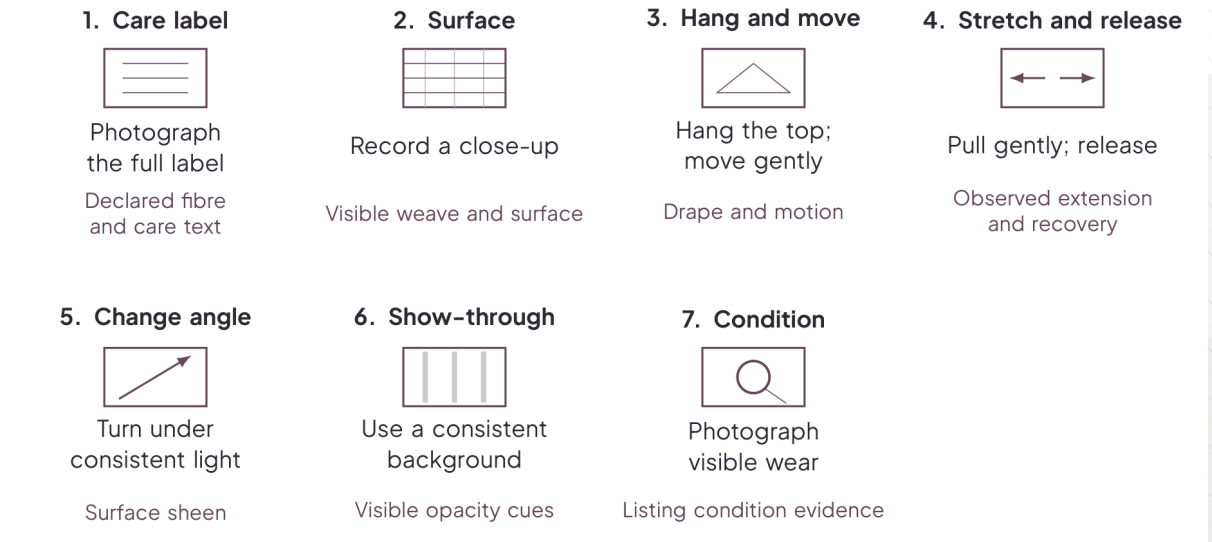

Figure 7. Seven capture views and the fabric information they support

Heavier analysis runs in the cloud. The system isolates the garment, tracks how it moves, and extracts descriptors for drape, observed extension and recovery, sheen, show-through and visible surface structure. Optical character recognition reads the care label, and the merchant confirms or corrects the text. Visible wear is flagged and linked to the original close-up. Each descriptor carries a reliability value, the capture conditions and a pointer to its source clip or image, and the profile records the protocol and model version that produced it.

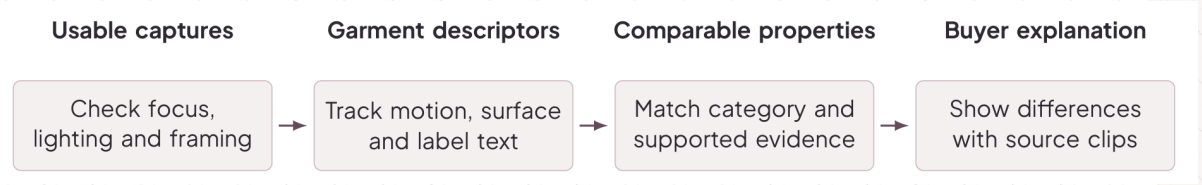

Figure 8. From usable captures to a property comparison

3.3 Reading the Garment Comparison

The comparison uses only descriptors that both garments support. Each is weighted by the properties the buyer says matter and by the weaker of the two reliability values. Missing evidence stays visible as unavailable instead of being estimated, and a result with too little shared evidence asks for a recapture rather than an overall verdict. The buyer reads differences such as similar drape, less observed stretch and a shinier surface in the recorded light, and can open the clip or crop behind each statement.

The result distinguishes observed properties, label declarations and unavailable information. Comparisons use compatible garment categories, and buyers can open the original captures behind each statement. Properties requiring physical touch, such as skin softness, remain unavailable. Appendix 10.2 explains the supporting technical design.

Figure 9. Comparison statements link to the original supporting captures

3.4 Architecture, Data and Processing Cost

The mobile website handles capture and viewing. A cloud service performs quality checks, garment tracking, appearance and motion analysis, label recognition and comparison, and a written explanation is generated only from the stored descriptors and evidence. Original photographs and clips sit in object storage, structured profiles and references in a managed database, and every statement points back to its source file. The same pipeline serves the merchant marketplace and, from 2029, external customers through an API and widget. Feedback after delivery can refine buyer preferences only where the buyer has consented and privacy controls are in place.

ReFeel will use a managed database, object storage and on-demand GPU processing to support a lean launch. Supabase, Cloudflare R2 and Modal provide the published pricing benchmarks used in the financial estimates (Supabase, n.d.; Cloudflare, n.d.; Modal, n.d.). The per-job budget includes five GPU seconds plus storage, retries and moderation. The same processing and evidence structure supports retailer API and widget services from 2029. Appendix 6 covers operating exceptions and Appendix 7 details delivery costs.

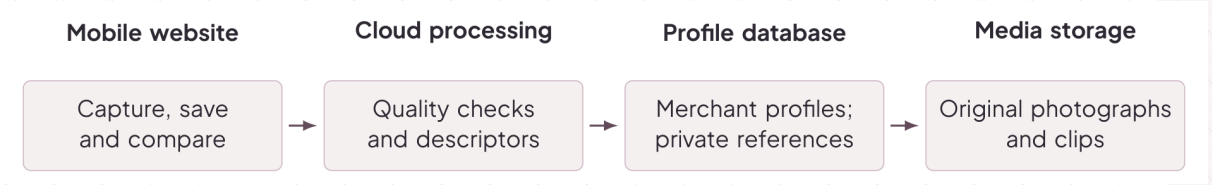

Figure 10. A shared architecture for mobile web and later retailer services

Information and access responsibilities

Record	Access and use
Public garment profile	Merchant listing information and accepted capture evidence can be shared.
Private buyer reference	The buyer returns through account sign-in and controls access and deletion.
Comparison output	Supported properties link to the corresponding source image or clip.
Processing record	Job and version identifiers reconcile publication, plan allowances and overages.

4 Market and Competitive Analysis

4.1 The First Merchants and Buyers

ReFeel starts with curated secondhand merchants in Jabodetabek who repeatedly list lightweight tops through social channels and marketplaces. These merchants need to explain individual garments without rebuilding the same information for each enquiry. A reusable profile fits their existing workflow and can be shared through the channels where they already reach buyers.

The buyer brings the personal reference, while the merchant pays for profiles or the optional Pro workflow. This gives the launch a clear commercial focus: recruit merchants with recurring listing activity, then introduce their audiences to the comparison experience. Concentrating the category and geography also makes onboarding and capture assistance more manageable for the two-founder team.

4.2 Market Size and Initial Reach

The 2031 market estimate covers 30.0 million online preloved clothing items in Indonesia, equivalent to Rp5.85 trillion at Rp195,000 per item. Initial categories and reachable geography define a serviceable market of 3.6 million items, or Rp702 billion. The market-sizing figure shows how the launch scope narrows this wider opportunity (Appendix 4).

ReFeel's Base forecast reaches approximately 21,022 successful orders in 2031, producing Rp4.10 billion in merchandise GMV. This represents about 0.584% of the estimated serviceable item volume. The sales forecast links merchant recruitment, buyer activity and completed orders to this initial reach. Only completed ReFeel checkouts enter this measure. Shared profiles can also support off-platform purchases, while profile charges, subscriptions and administration fees generate company revenue.

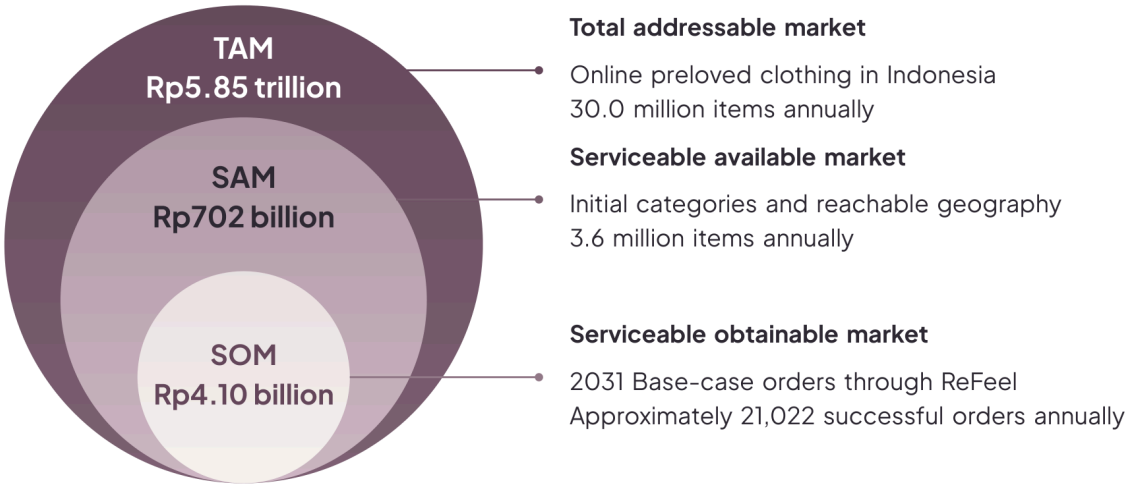

Figure 11. 2031 market scope and reachable demand

4.3 Competing on Fabric Evidence

Established alternatives already help customers find garments and ask questions. Carousell combines recommerce listings and chat (Carousell Group, n.d.). Merchant photographs, videos and direct replies are familiar ways to explain an item. ReFeel gives merchants reusable comparison evidence to share in these conversations.

Fit Analytics provides a retailer-integrated size advisor, while True Fit offers size and fit intelligence and shows a closet-item input (Fit Analytics, n.d.; True Fit, n.d.). ReFeel's position centres on observable fabric behaviour: standardized captures, the buyer's own garment and supporting media in one comparison. Merchants can add this information to existing sales activity, then use ReFeel checkout when a buyer chooses that route. The competitor matrix compares these customer tasks and documented capabilities (Appendix 4).

Table 1. Competitive decision focus

Alternative	Main decision supported	ReFeel comparison
Carousell / seller media	Find listings and ask the seller	Shared profiles add standardized capture evidence
True Fit / Fit Finder	Select a size or fit	ReFeel focuses on observable fabric behaviour
ReFeel	Compare a listing with an owned garment	Guided capture, evidence access and visible unknowns

Sources: Carousell Group (n.d.), True Fit (n.d.) and Fit Analytics (n.d.). Full capability evidence and limits: Appendix 4.2.

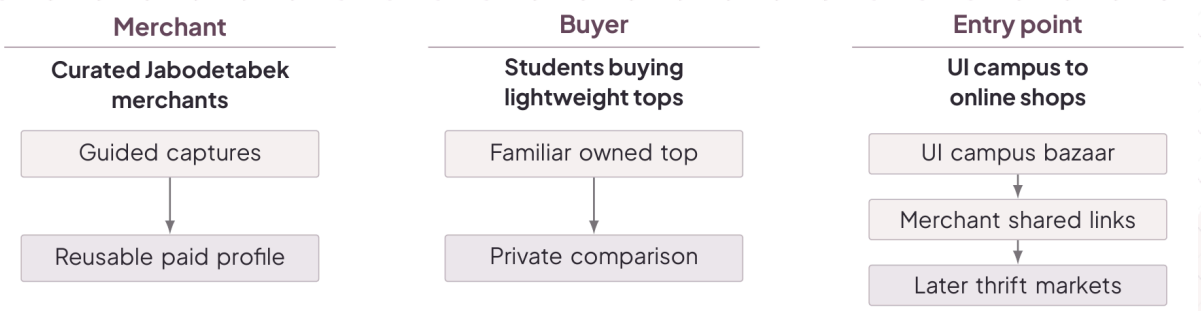

Figure 12. The launch connects recurring merchant listings with campus buyers

The merchant keeps the sale channel

A merchant can use the same garment profile in a marketplace listing, a social post or a direct conversation. The buyer follows the link, compares the item with a private reference and returns to the merchant's chosen purchase route. ReFeel therefore earns profile revenue independently of where the final sale occurs. Only successful ReFeel checkout contributes administration income.

5 Marketing and Growth Strategy

5.1 Merchant-Led Market Entry

We will launch through curated secondhand merchants whose buyers already discover clothing through TikTok, Instagram and seller conversations. The offer connects one unfamiliar listing with a garment the buyer knows. Merchants will receive a reusable profile link for their existing channels, while buyers can save a familiar-garment reference through the mobile website. Demonstrations will show one supported difference at a time, such as drape or stretch. Merchants can publish a PAYG profile for Rp2,000 or choose Pro at Rp199,000 per month, including 100 profiles.

Figure 13. From a campus encounter to later online comparison

5.2 Campaign: Baju Andalanmu

We will introduce Baju Andalanmu, a campus campaign built around the invitation “Baju favoritmu, acuan belanja barumu.” Students bring a favourite top, turn it into a private reference through guided capture, and compare it with a merchant listing. The first target is a Universitas Indonesia campus bazaar, with permission and event arrangements completed before activation.

At the station, participants record the required photos and clips, save their reference and see one fabric comparison. A Reference Pass provides the route back to their account. Merchants receive capture assistance and publish eligible garments under PAYG or Pro, with a public profile tag for each listing. Optional hands-only videos carry #BajuAndalanmu into TikTok and Instagram; Appendix 5 shows the execution sequence.

Figure 14. Baju Andalanmu brings a familiar garment into the online buying journey

Figure 15. The invitation explains what to bring and what participants will do

Figure 16. A repeatable four-frame hands-only social sequence

5.3 From Campus Participation to Repeat Use

After the activation, opted-in follow-up will bring participants back to saved references and relevant merchant listings. Merchant demonstrations will introduce the social format; optional buyer remixes will carry #BajuAndalanmu through TikTok and Instagram collaboration posts. We will track later comparisons, successful checkouts and repeat paid publishing to choose the next activation. Campus activity comes first, followed by selected thrift-market counters using the same reference and profile system.

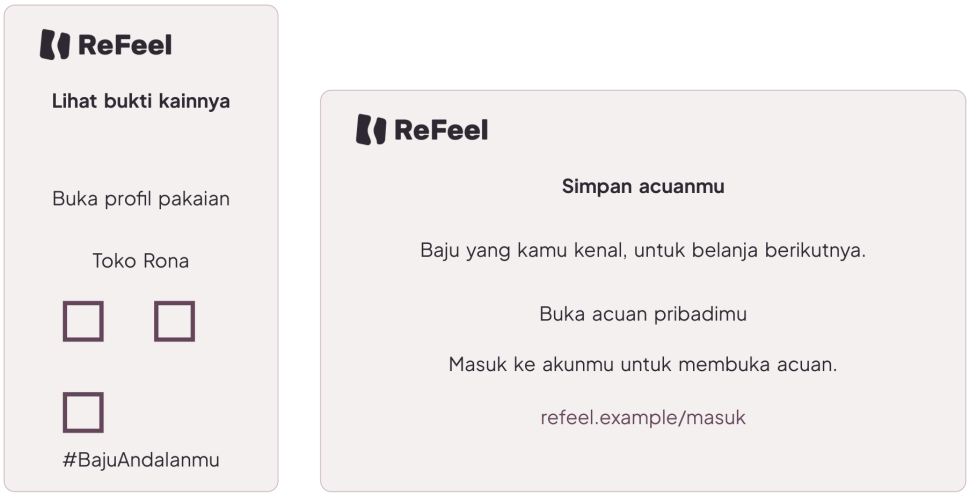

Figure 17. A public garment profile tag and a private Reference Pass

Figure 18. A thrift counter preserves garment evidence for later online use

From first encounter to repeat use

The campus station creates the first saved reference. Follow-up through agreed channels brings the participant back to a merchant listing, while optional remixes show the comparison to other shoppers. At selected thrift markets, visitors save a profile for later use after physically inspecting the garment. The same reference and profile system connects both settings.

6 Operations and Human Resources

6.1 From Capture to Completed Purchase

A merchant creates a garment profile through guided photographs and short movement clips. ReFeel checks the captures, requests any missing evidence and publishes an accepted profile. The merchant can share that link in an existing listing or offer the item through ReFeel. One profile therefore supports more than a single enquiry.

The buyer chooses a familiar garment from their private references, compares it with the listing and opens the supporting media before purchasing. For a ReFeel order, payment confirmation leads to merchant dispatch, receipt, support and settlement. Merchants retain their stock and handle fulfilment. Purchases completed through another channel still benefit from the profile, while ReFeel charges administration only on successful ReFeel checkout. Appendix 6 follows each actor and the exception routes.

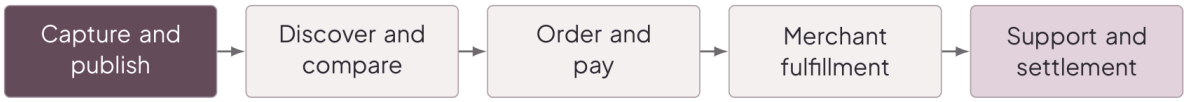

Figure 19. ReFeel service from capture to settlement

6.2 Team and Resource Plan

Two founders will run the initial service. The product founder will lead development, capture quality and technical delivery. The commercial founder will recruit merchants, coordinate the campaign and manage customer communication and cash monitoring. Specialist contractors and operations assistance will add capacity as required.

This structure keeps fixed commitments manageable during launch. From 2029, external integrations will add defined delivery and support work. The founders will increase contractor capacity in stages, using processing demand and support workload to decide where help is needed.

Figure 20. Lean functional responsibilities

6.3 Quality and Service Capacity

A useful comparison begins with usable evidence. ReFeel will identify the capture that needs correcting and leave unsupported properties unavailable. The product founder will review recurring problems with textile specialists before extending garment coverage.

Job records will reconcile published profiles, included plan usage and overages so repeated views do not trigger duplicate processing charges. Buyer references will remain private, with account access and deletion controls. When review queues or support demand exceed capacity, the founders will narrow intake and resolve the bottleneck before increasing acquisition.

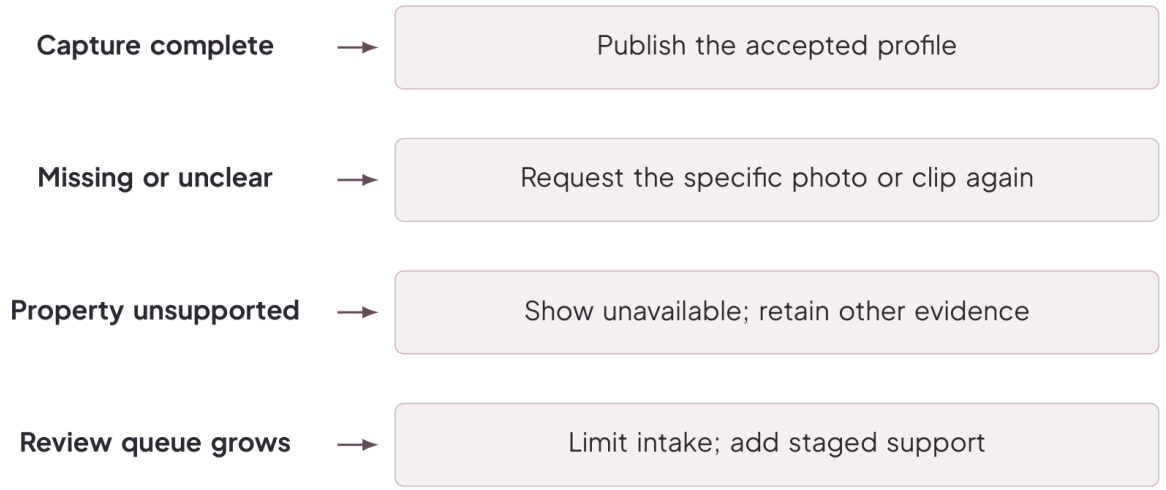

Figure 21. Specific quality checks lead to specific operating actions

Capacity follows the workload

The product founder owns capture quality and technical delivery; the commercial founder owns merchant onboarding, customer communication and campaign coordination. Contractors support engineering and textile review. Operations assistance grows with capture and order workload, within the staged budgets in Appendix 7.6.

Monthly resource budget / IDR million	2027	2029	2031
Founders combined	6	12	18
Engineering and specialists	4	18	36
Support and merchant operations	1	8	26
Capture and textile quality review	2	3	5

7 Financial Plan

7.1 Funding the Launch and Expansion

ReFeel will develop in two funding stages. During 2027–2028, Rp300 million of founder capital will support product development, merchant recruitment, and the Q3 2027 commercial launch. Two founders and specialist contractors will manage the initial service. From January 2029, a planned Rp255.48 million equity raise will support the external SaaS, API and widget offering, integration work and additional service capacity. This sequence allows the team to establish the merchant business before expanding into retailer services.

Income will come from paid garment profiles, Pro subscriptions and buyer administration fees, followed by external subscriptions, usage overages and integration fees. Reusable profiles will support merchants across their existing sales channels. Detailed prices, costs and funding estimates appear in Appendix 7.

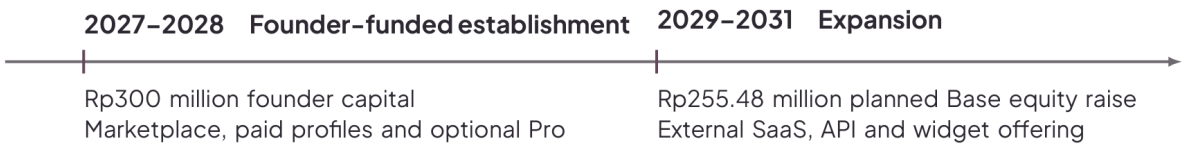

Figure 22. Two funding stages

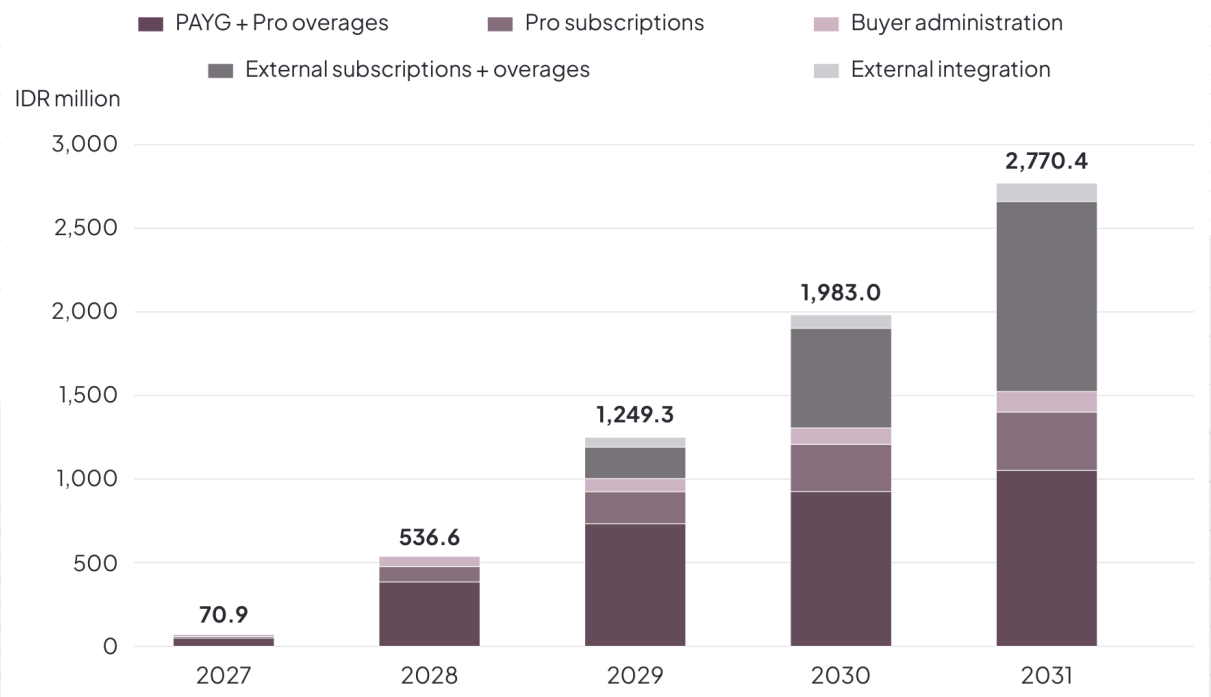

Figure 23. The revenue mix expands from merchant services to retailer integrations

7.2 Revenue Growth and Operating Profit

Base revenue is projected to grow from Rp70.87 million in 2027 to Rp2.77 billion in 2031. Annual EBIT is expected to turn positive in 2029 and reach Rp497.62 million in 2031, a 17.96% margin. The initial investment will therefore fund the period in which product development and customer acquisition precede sufficient operating income.

Processing, payments, support and integration costs will grow with service activity, while staffing will increase in stages. Merchandise GMV is projected at Rp4.10 billion in 2031 and remains separate from ReFeel revenue. The cash projection includes receivables, capital expenditure and the planned expansion funding.

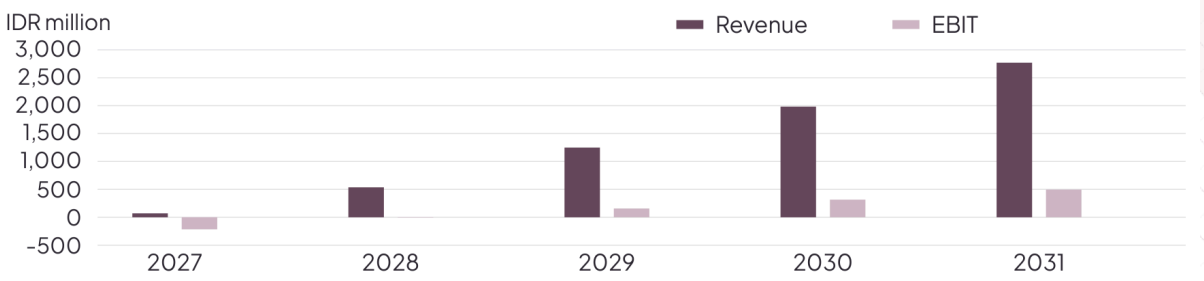

Figure 24. Base-case revenue and operating earnings

Table 2. Base financial estimates

IDR million	2027	2028	2029	2030	2031
Revenue	70.87	536.57	1,249.29	1,983.03	2,770.40
EBIT	-215.72	-6.45	157.20	315.79	497.62
Project free cash flow	-231.72	-7.51	101.03	193.45	346.96
Closing cash including financing	68.28	60.77	417.27	610.73	957.68

IDR million. Cash includes financing; project free cash flow excludes it.

7.3 Returns and Financial Discipline

The Base forecast confirms operating break-even in September 2028 after three consecutive positive EBIT months, with cumulative project cash payback in November 2030. Five-year project NPV is Rp40.75 million at the team-selected 25% annual hurdle, with a 31.09% annualized project IRR. These project returns exclude financing and terminal value. Appendix 7.4 presents the separate DCF valuation.

Growth will require cash discipline. Estimated 2031 contribution LTV/CAC is 3.66× for sellers and 8.51× for external businesses, but only 0.34× for buyers, so paid buyer acquisition will remain capped. Base cash stays positive but falls short of the six-month reserve by up to Rp125.17 million. Downside has a Rp201.05 million pre-expansion financing gap, and its 2029 raise leaves later deficits. The team will stage spending and secure sufficient funding before extending operations.

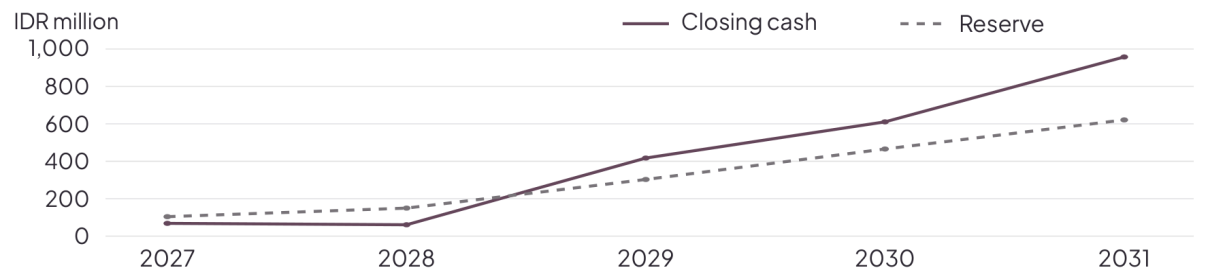

Figure 25. Year-end cash and six-month fixed-cost reserve

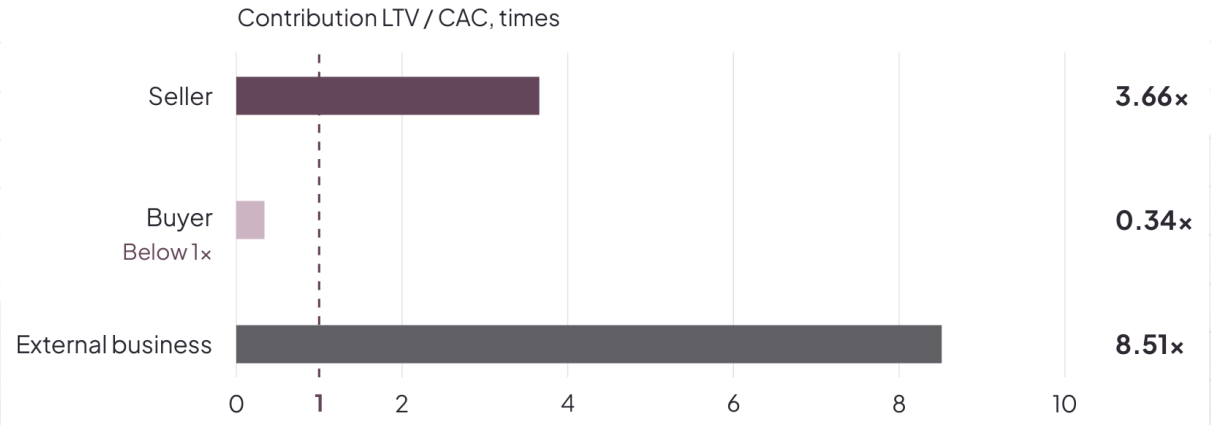

Figure 26. Seller and external-business economics support disciplined acquisition

8 Sustainability, Risks, Implementation and Conclusion

8.1 Enterprise Sustainability and Impact

Merchants can reuse garment profiles across enquiries and sales channels, while buyers can bring a familiar reference to their next secondhand purchase. ReFeel connects those repeat uses with a business that earns from useful information. The team will track repeat publishing, completed purchases and buyer-reported garment use to assess how the service supports continued secondhand activity.

Post-purchase questions will ask whether the garment met expectations and remained in use. Response rates will accompany the findings. Claims about avoided production or emissions would require separate evidence; Appendix 9 defines the outcomes this service can measure.

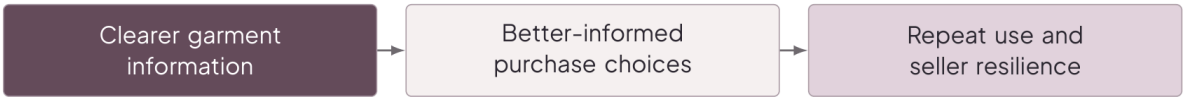

Figure 27. Intended customer and enterprise outcomes

8.2 Managing the Risks to Growth

Growth depends on merchants finding the profile worth their time and payment. The commercial founder will monitor repeat publishing and respond to weak retention by simplifying the workflow. The product founder will address disputed observations through recapture, evidence review and limits on unsupported categories.

Cash and capacity will govern expansion. The founders will cap weak paid-acquisition channels, stage contractor commitments and arrange financing before taking on wider obligations. Access controls and private-reference handling will protect buyer media. Appendix 9 assigns each risk a trigger, response and accountable owner.

Table 3. Priority operating risks

Risk	Operating response
Capture inconsistency	Request recapture; narrow the supported category
Weak buyer contribution	Cap paid acquisition; prioritize merchant and external retention
Cash shortfall	Stage commitments and secure financing before expansion

Detailed triggers and responsibilities: Appendix 9.2 and Appendix 9.3.

8.3 Implementation from 2027 to 2031

Implementation will begin in 2027 with capture rules, the mobile web service, merchant onboarding and payment preparation. The Q3 commercial launch will introduce paid profiles and the optional Pro plan. The planned UI campus activation will connect merchant demonstrations with saved buyer references and later online use.

During 2028, the team will improve the publishing workflow, support routines and distribution before the external widget trial. The January 2029 expansion stage will introduce SaaS, API and widget services alongside integration procedures and additional support. In 2030–2031, the business will extend partnerships and operating capacity as contribution and cash permit. Appendix 8 details the workstreams and completion criteria.

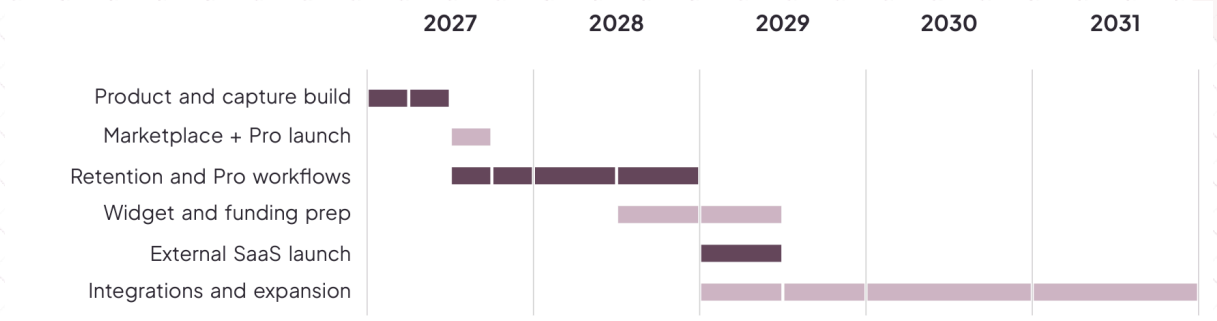

Figure 28. Implementation sequence from launch to expansion

8.4 Conclusion

ReFeel offers a practical way to explain secondhand clothing online: merchants provide reusable captures, and buyers bring a garment they understand. A focused launch and the Baju Andalanmu campaign give that service a clear route to market. Paid profiles establish the first business, while later integrations extend its reach. Founder capital will build the merchant service; expansion equity will support retailer integrations from 2029.

2.1 Dataset Coverage and Access

Return to related chapter

Women's E-Commerce Clothing Reviews and the UCSD ModCloth and Rent the Runway tables provide the historical evidence used in Chapter 1 (Nicapotato, n.d.; Misra et al., 2018). Duplicate removal and review-body eligibility are separate steps.

Table 5. Dataset coverage

Dataset	Original rows	After duplicates	Eligible bodies
Women	23,486	23,465	22,640
ModCloth	82,790	82,413	75,704
RentTheRunway	192,544	192,355	192,353

The combined evidence covers 298,820 original records and 290,697 eligible review bodies. The data describe historical overseas clothing reviews; they inform the information problem rather than establish Indonesian purchase demand.

Women's E-Commerce Clothing Reviews

UCSD clothing-fit datasets

Clothing-fit research paper

2.2 Language Rules and Statistical Method

Return to related chapter

Version 2.1 uses deterministic rules across eligible review bodies. Six property families cover stretch, drape, texture, sheen, opacity and thickness. A mismatch detection requires a property term, expectation cue and comparison cue in the same sentence within a combined 180-character span. Favourable surprise can satisfy that definition. A non-match means that the rules found no qualifying phrase.

Seven exploratory tests form one Holm-adjusted family. Category and recommendation use chi-square and Cramér's V. Fit groups use Kruskal–Wallis with epsilon squared. Mismatch and rating use Mann–Whitney with rank-biserial correlation. The two-by-two recommendation test uses Yates correction. Product-level sensitivities are unadjusted checks and do not resolve all repeated-user dependence.

A separate outcome-blinded GPT audit reviews an enriched fixed sample of 60 passages. Property detection has 97.6% precision and 93.2% recall in that sample; mismatch detection has 95.8% precision and 95.8% recall. These are sample diagnostics, not human ground truth or full-corpus accuracy. The study makes no substantive uncertainty-prevalence claim.

Appendix 3 Detailed Dataset Findings

3.1 Fabric Language and Recommendation

Return to related chapter

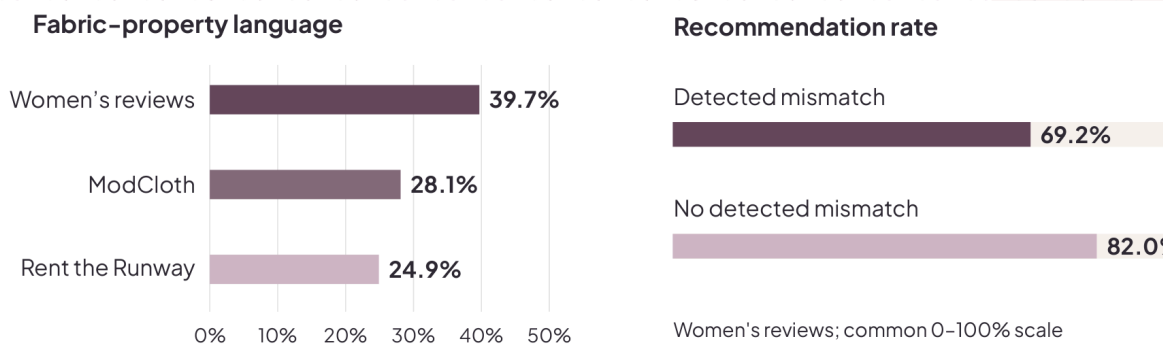

Figure 29. Fabric language and shopping outcomes

Review data: Nicapotato (n.d.); Misra et al. (2018). Calculations follow Appendix 2.

Table 6. Detected language in eligible review bodies

Dataset	Property detections	Rate	Mismatch detections	Rate
Women	8,983	39.7%	237	1.05%
ModCloth	21,290	28.1%	1,087	1.44%
RentTheRunway	47,866	24.9%	1,710	0.89%

In the Women's dataset, recommendation rates are 69.2% with detected mismatch language and 82.0% otherwise. The 12.8 percentage-point difference is observational. The calculated paired within-product sensitivity is marginal at unadjusted p = .048.

3.2 Statistical Results and Product Sensitivities

Return to related chapter

Table 7. Exploratory associations

Dataset and association	n	Effect	Holm p	Product p
Women / Category vs recommendation	23,451	0.053	<.001	<.001
ModCloth / Fit group vs quality score	82,345	0.047	<.001	<.001
RentTheRunway / Fit group vs rating	192,274	0.057	<.001	<.001
Women / Detected fabric mismatch vs recommendation	22,640	-0.128	<.001	0.048
Women / Detected fabric mismatch vs rating	22,640	-0.217	<.001	<.001

Dataset and association	n	Effect	Holm p	Product p
ModCloth / Detected fabric mismatch vs quality score	75,639	-0.213	<.001	<.001
RentTheRunway / Detected fabric mismatch vs rating	192,272	-0.156	<.001	<.001

Effect measures follow Appendix 2.2. The recommendation-rate effect is a proportion difference; multiply by 100 for percentage points. Product p values are unadjusted. Very small values are reported as inequalities. Rating scales remain separate: 1–5 for ModCloth and Women's reviews, and 2–10 in even steps for Rent the Runway.

Appendix 4 Market and Competitive Evidence

Return to contents

4.1 Market Scope and Calculations

Return to related chapter

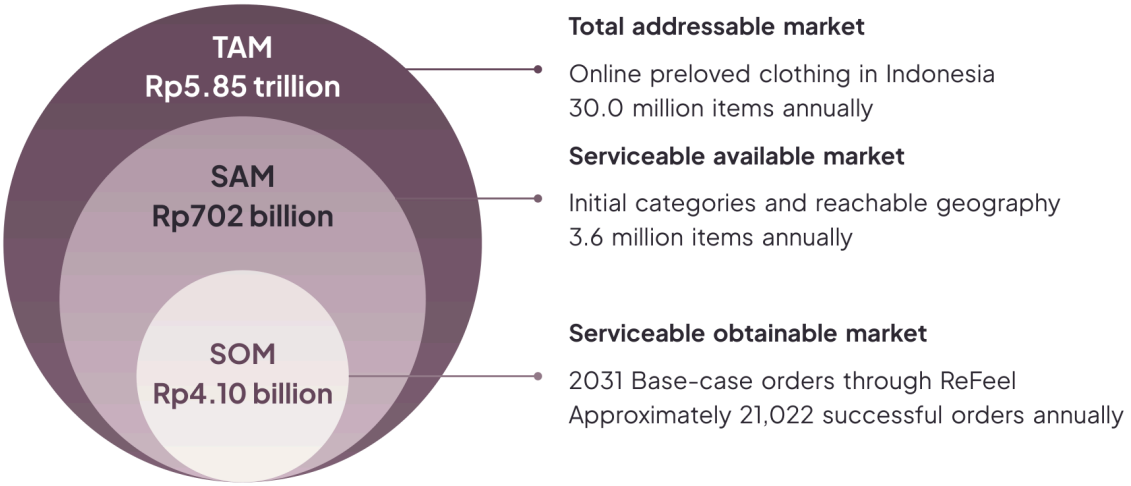

Figure 30. 2031 market scope and reachable demand

The 2031 estimates describe annual merchandise activity. TAM and SAM define the opportunity; SOM follows successful orders in the acquisition and checkout forecast. The market inputs use a Rp195,000 item value and a 12% serviceable share.

Table 8. Market calculations

Scope	Annual items or orders	Value per item	Merchandise GMV
TAM	30,000,000	Rp195,000	Rp5.85 trillion
SAM	3,600,000	Rp195,000	Rp702 billion
SOM	21,022.31	Rp195,000	Rp4.099 billion

TAM = 30,000,000 × Rp195,000. SAM = 3,600,000 × Rp195,000. SOM = 21,022.3095 successful orders × Rp195,000. Circle sizes are schematic. Purchases completed outside ReFeel are excluded from checkout GMV.

4.2 Competitor and Substitute Evidence

Return to related chapter

The comparison focuses on the task each alternative supports. ReFeel's distinction is standardized capture evidence and fabric comparison. True Fit already documents an owned-garment input. An undocumented capability is not treated as proven absent.

Table 9. Tasks and distribution

Alternative	Documented customer task	Retailer embedding
Carousell	Recommerce listings and chat	Not established by reviewed page

Alternative	Documented customer task	Retailer embedding
True Fit	Size and fit intelligence	Documented
Fit Finder	Personalized size recommendation	Documented PDP widget
Seller photos video and chat	Direct garment information	Existing merchant channels
ReFeel	Observable garment comparison	External widget/API planned for 2029

Table 10. Reference and evidence scope

Alternative	Owned-garment input	Capture-based fabric comparison
Carousell	Not established by reviewed page	Not documented in reviewed page
True Fit	Closet-item input shown for size context	Not established by reviewed page
Fit Finder	Not established by reviewed documentation	Not documented in reviewed documentation
Seller photos video and chat	Buyer can ask for familiar comparisons manually	Unstandardized; depends on seller
ReFeel	Buyer-owned capture is central to proposed workflow	Standardized capture and evidence-linked comparison are planned

Carousell Group

True Fit

Appendix 5 Baju Andalanmu Campaign

Return to contents

5.1 Campaign Purpose and Audience

Return to related chapter

Baju Andalanmu introduces ReFeel through an action people can understand: bring a favourite top and save it as an online-shopping reference. The campaign line is “Baju favoritmu, acuan belanja barumu.”

Figure 31. Campus reference capture station

The first target setting is a Universitas Indonesia campus bazaar, subject to event access and permission. Students who shop for secondhand clothing are the buyer audience; curated merchants with lightweight tops are the paying profile audience. The same campaign identity continues at selected thrift-market counters.

5.2 The Campus Experience

Return to related chapter

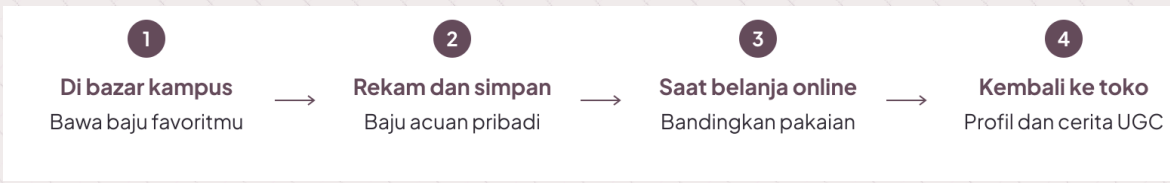

Figure 32. The participant journey

Before the event. The commercial founder will arrange campus access, invite eligible merchants and circulate the poster through agreed student and clothing communities. Participants will be asked to bring a top they already know.

At the station. Operations support will guide photographs and movement clips. The participant will save the accepted reference privately, then compare a merchant listing and inspect one supported difference.

For merchants. Capture assistance will prepare eligible stock for normal PAYG or Pro publication. A hangtag will link each accepted garment to its public profile, ready for use in later listings and enquiries.

After the event. The Reference Pass will bring the participant back through account sign-in. Opted-in follow-up will point to saved references and merchant profiles. Participants can share a hands-only clip if they choose.

5.3 Campus Poster

Return to related chapter

Figure 33. Campus invitation poster

Distribute the poster through agreed campus channels once the venue and event details are confirmed. The invitation tells participants what to bring and what they will leave with. Event details and access destinations remain placeholders until arranged.

5.4 Garment Tags and the Reference Pass

Return to related chapter

Figure 34. Printed campaign kit

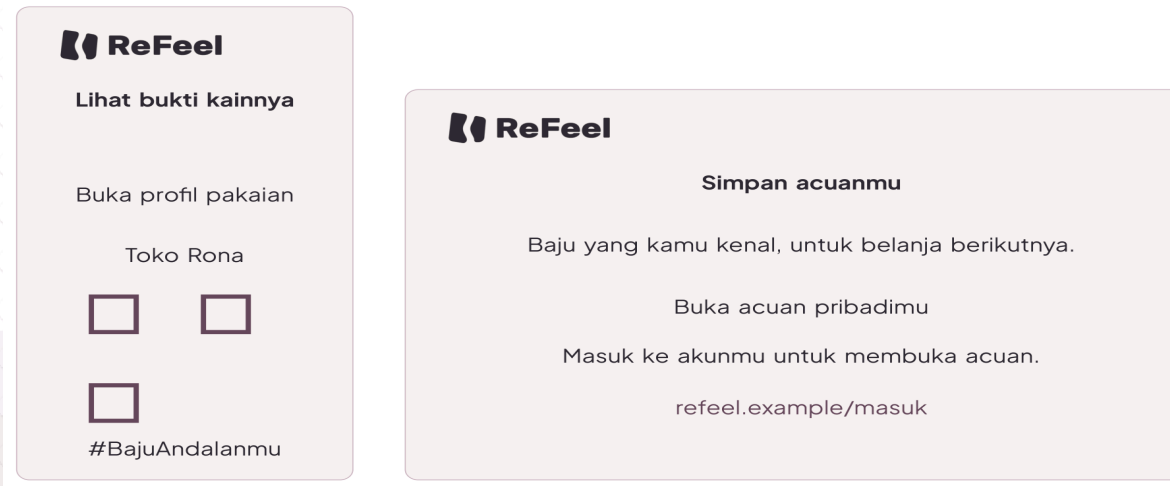

Figure 35. Garment tag and Reference Pass

The merchant tag opens a public garment profile. The Reference Pass leads through account sign-in to a private saved reference, giving the participant a return route after leaving the event.

5.5 From Campus to Thrift Markets

Return to related chapter

Figure 36. Thrift-stall display and garment profile tags

At a thrift market, visitors can already inspect the fabric. ReFeel's role is to make that encounter useful later: save the garment profile, retain a familiar reference and compare a later online listing. The merchant can reuse the profile link after the stall closes.

The commercial founder will select merchant counters, supply the display and profile tags, and follow repeat publishing and later comparisons before extending the format. Merchants publish through PAYG or Pro, and buyer administration applies only to successful ReFeel checkout.

5.6 The Hands Only UGC Format

Return to related chapter

Figure 37. A repeatable four-frame social video

Merchants will demonstrate the format first. Buyers can then show their favourite top, the saved-reference step and one supported comparison in their own words. TikTok posts and Instagram collaboration posts will carry #BajuAndalanmu and direct viewers to a public merchant profile or the account-entry route.

Selected footage will be used with permission. Public edits will show only the media and results the owner has agreed to share. Private reference captures remain inside the buyer’s account.

5.7 Four Week Activation Sequence

Return to related chapter

The four weeks below organize an activation cycle. The event date follows campus access and scheduling. The commercial founder coordinates delivery with product and operations support.

Table 11. Activation schedule

Week	Action	Materials and delivery	Measure
1	Merchant and community invitations	Poster for the Universitas Indonesia target activation, distributed through agreed campus channels after permission; Merchant hands-only demonstration; Capture preparation instructions	Attributed visits and reference starts
2	Campus reference station	Guided reference capture; Reference Pass; Merchant hangtags; Optional UGC capture	Completed references, recapture reasons and completed comparisons

Week	Action	Materials and delivery	Measure
3	Online continuation	Return-to-reference message through opted-in channels; Merchant listing comparisons; Instagram collaboration post	Later reference reuse, profile views and successful checkout
4	Remix and next activation decision	Permissioned buyer/merchant UGC; Summary of actual channel events; Decision on the next campus session or later thrift-market counter	Repeat paid publishing, attributed activation and content-assisted comparison

5.8 Measures that Guide the Next Activation

Return to related chapter

Table 12. Campaign measures

Stage	Recorded action	Operating use
Discovery	Attributed visits to a public garment profile	Identify which merchant and campus channels bring relevant traffic
Reference creation	Accepted reference saved to a buyer account	Track completed capture and reasons for recapture
Comparison and return	Completed comparison and reference use after the first session	Test whether the offline encounter supports later online use
Merchant activation	First paid publication or eligible Pro inclusion	Reconcile useful merchant activity with billing
Commercial continuation	Successful ReFeel checkout and repeat paid publishing	Choose channels and locations for the next activation

Profile views, completed references, comparisons and sales remain separate measures. Purchases through a merchant’s own channel do not become ReFeel checkout revenue. Campaign decisions will follow these actions alongside delivery cost and support workload.

Appendix 6 Operations and Resources

Return to contents

6.1 Detailed Service Workflow

Return to related chapter

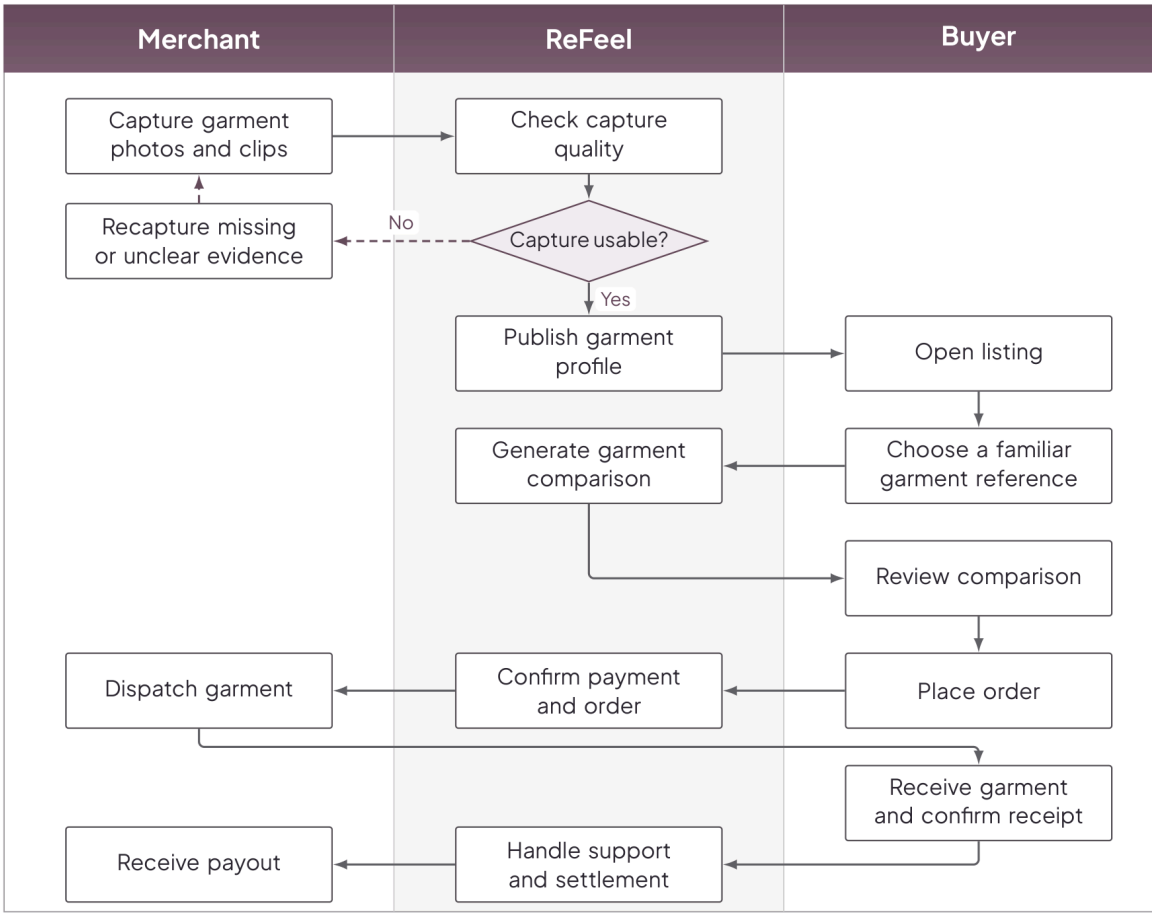

Figure 38. Detailed marketplace service workflow

Merchants can share paid profiles through their existing channels. Their off-platform sales do not create ReFeel administration revenue. Evidence gaps lead to recapture, a narrower output or support escalation. Buyer reference media stay private.

6.2 Operating Responsibilities

Return to related chapter

Workstream	Accountable role	Routine evidence and escalation
Capture and comparison	Product founder	Capture checks, unavailable properties, retry records and specialist review
Merchant onboarding	Commercial founder	First usable profile, published fee policy and merchant support history
Orders and buyer support	Commercial founder with operations support	Payment state, merchant dispatch, receipt and complaint record

Workstream	Accountable role	Routine evidence and escalation
Metering and billing	Product founder	Unique job identifier, plan allowance, overage and account reconciliation
Content and events	Commercial founder	Permission record, production calendar and attributed actions
Financial monitoring	Both founders	Monthly cash forecast, reserve gap, contribution and capacity review
External integrations	Product founder with contractor	Integration scope, usage limits and support handover from 2029

6.3 Exception Handling

Return to related chapter

Exception	Service response	Accountable role
Incomplete capture	State the missing evidence and request recapture; cap repeated processing	Product founder
Unsupported observation	Leave the property unavailable and retain the supporting capture	Product founder
Payment failure	Keep the order unconfirmed; reconcile the payment state before dispatch	Commercial founder
Merchant dispatch problem	Notify the buyer and resolve through the published order terms	Commercial founder
Complaint or refund request	Record the issue, retain relevant transaction evidence and apply published terms	Commercial founder
Private-media request	Provide account access or deletion handling; restrict media use to the permission given	Product founder
Processing or support backlog	Narrow intake, prioritize existing obligations and add capacity within approved resources	Both founders

Appendix 7 Financial Schedules and Estimates

Return to contents

7.1 Commercial Estimates

Return to related chapter

The forecast links acquisition, retention, usage, pricing and delivery cost. Merchandise GMV and merchant settlement money remain separate from company revenue. External subscriptions are collected one month after recognition; development spending is expensed and hardware is depreciated.

Table 13. Pricing and billing

Item	Payer	Price or cost (IDR)	Billing basis
PAYG profile	Merchant	2,000	Per published paid profile
Pro subscription	Merchant	199,000	Monthly; includes 100 profiles
Pro overage	Merchant	2,000	Per profile above included allowance
Buyer administration	Buyer	3%, capped at Rp7,500	Successful ReFeel checkout only
External subscription	External business	1,500,000	Monthly; includes 1,000 jobs
External API overage	External business	1,500	Per job above included allowance
Integration fee	External business	3,000,000	Once per new external customer
Integration delivery cost	ReFeel	1,500,000	Once per new external customer

Paid buyer acquisition remains capped. Merchant and external-business acquisition have separate budgets. The forecast does not add a separate viral-growth uplift for campaign activity.

7.2 Annual Financial Statements

Return to related chapter

Table 14. Base financial statements

IDR million	2027	2028	2029	2030	2031
Successful merchandise GMV	439.02	2,028.43	2,656.17	3,299.12	4,099.35
Recognized revenue	70.87	536.57	1,249.29	1,983.03	2,770.40
Direct operating costs	17.65	113.04	267.07	432.06	621.19
Gross profit	53.22	423.53	982.22	1,550.97	2,149.20

IDR million	2027	2028	2029	2030	2031
Fixed operating expenses	208.14	299.58	605.82	931.50	1,242.30
Marketing and recruitment	52.80	122.40	211.20	295.68	401.28
EBITDA	-207.72	1.55	165.20	323.79	505.62
Depreciation	8.00	8.00	8.00	8.00	8.00
EBIT	-215.72	-6.45	157.20	315.79	497.62
Tax provision	0.00	9.07	36.50	69.47	109.48
Net income	-215.72	-15.51	120.70	246.31	388.15
Operating cash flow	-207.72	-7.51	101.03	217.45	346.96
Capital expenditure	24.00	0.00	0.00	24.00	0.00
Project free cash flow	-231.72	-7.51	101.03	193.45	346.96
Founder equity	300.00	0.00	0.00	0.00	0.00
Expansion equity	0.00	0.00	255.48	0.00	0.00
Closing cash	68.28	60.77	417.27	610.73	957.68
Six-month fixed-cost reserve	104.07	149.79	302.91	465.75	621.15
Cash above or below reserve	-35.79	-89.02	114.36	144.98	336.53

IDR million. GMV belongs to merchants; company revenue comprises service income.

7.3 Funding and Unit Economics

Return to related chapter

Table 15. Funding stages

Source or policy	Timing	Amount or rate	Meaning
Founder capital	January 2027	Rp300.00m	Contributed once; no debt
Expansion equity	January 2029	Rp255.48m	Base-case estimate, not committed
Pre-money value for dilution	January 2029	Rp1,500.00m	Negotiation estimate, distinct from DCF
Estimated new investor ownership	January 2029	14.55%	Raise / (pre-money + raise)

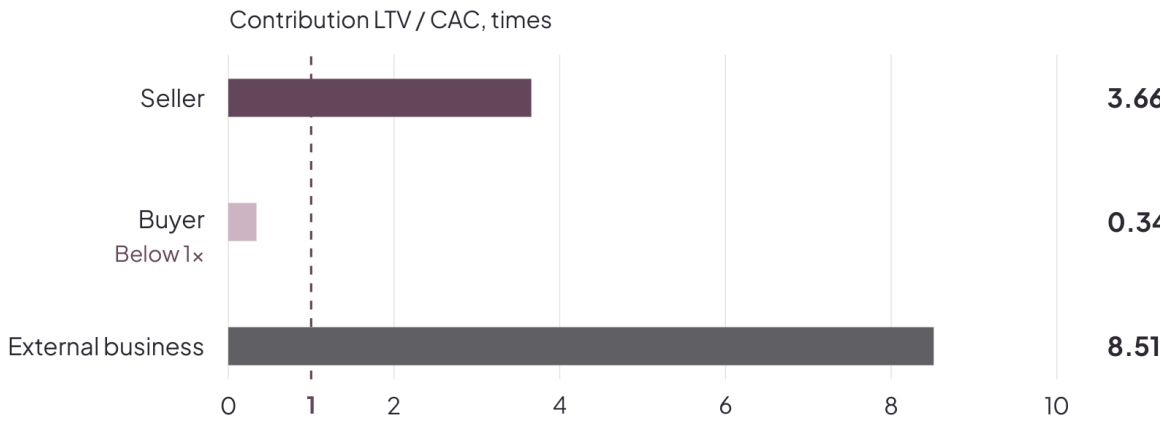

Figure 39. 2031 contribution LTV relative to acquisition cost

Table 16. 2031 contribution economics

Customer	CAC IDR	24-month LTV IDR	LTV / CAC	Payback months
Seller	564,596	2,064,833	3.66×	4.19
Buyer	79,737	27,139	0.34×	16.18
External Business	3,322,368	28,283,619	8.51×	2.26

CAC includes allocated team time per new customer; LTV uses the closing-month 24-month contribution estimate. Simple CAC payback uses recurring contribution before churn and excludes one-time integration profit for external businesses. These estimates are not observed customer cohorts.

7.4 Scenarios and Valuation

Return to related chapter

Table 17. Scenario comparison

Case	NPV (Rp million)	IRR	BEP month	Payback month	2029 equity (Rp million)
Base	40.75	31.09%	21	47	255.48
Downside	-1,202.94	n.a.	Not reached	Not reached	887.59
Upside	181.83	49.88%	20	41	238.06

Month 1 is January 2027. Operating break-even confirms three consecutive positive EBIT months.

Five-year project NPV and annualized project IRR exclude financing and terminal value. Cash ROI is net project free cash flow divided by the absolute sum of negative monthly project cash flows; the Base result is 129.04%. Project returns do not represent a promised investor return.

The separate DCF enterprise value is Rp579.36 million before funding. Discounted terminal value supplies approximately 92.97% of that amount. The 25% annual discount hurdle is a selected planning rate. This continuing-business valuation therefore answers a different question from five-year project NPV.

Base cash stays positive, with a minimum pre-expansion balance of Rp24.62 million, but the reserve gap reaches Rp125.17 million. Downside has a Rp201.05 million deficit before January 2029 and later unfunded deficits after its planned raise. Negative forecast cash denotes missing financing. Downside NPV is negative Rp1.203 billion, with no reached break-even or payback.

7.5 Acquisition Retention and Usage Inputs

Return to related chapter

Table 18. Acquisition and activity estimates

Driver	Unit	2027 input	2031 input
Paid acquisition cost per activated seller	IDR/seller	180,000	450,000
Cost per qualified buyer lead	IDR/lead	25,000	45,000
Qualified lead to first purchase	%	75.0%	75.0%
Monthly seller churn	%	3.0%	4.0%
Monthly purchasing buyer churn	%	18.0%	18.0%
Monthly business subscription churn	%	2.5%	2.5%
Profiles per standard seller per month	profiles/seller	40	50
Pro share of active marketplace sellers	%	8.0%	20.0%
Average order merchandise value	IDR/order	175,000	195,000

Acquisition inputs describe their stated funnel stage. Fully loaded CAC also allocates team time. External-business settings take effect when the service launches in January 2029.

7.6 Delivery and Staffing Inputs

Return to related chapter

Table 19. Delivery and staffing estimates

Driver	Unit	2027 input	2031 input
Cancelled / refunded order share	%	5.0%	5.0%
Payment gateway blended variable fee	% of attempted GMV	1.0%	1.0%
Payment gateway blended fixed fee	IDR/attempt	200	200
GPU runtime per profile / API job	seconds/job	5	5
Other processing, storage and retries	IDR/job	230	230
Managed database baseline	USD/month	25	25
Two founders combined monthly stipends	IDR/month	6,000,000	18,000,000
Engineering and specialist contractors	IDR/month	4,000,000	36,000,000

Driver	Unit	2027 input	2031 input
Support and merchant operations	IDR/month	1,000,000	26,000,000

Infrastructure and transaction pricing provide benchmarks. Processing runtime, retry allowances, support time and capacity remain operating estimates. The tax provision uses 22% of positive monthly EBIT without loss carryforwards; it is a forecast input rather than a determination of final tax treatment (Supabase, n.d.; Cloudflare, n.d.; Modal, n.d.; Midtrans, n.d.).

Supabase pricing

Cloudflare R2 pricing

Modal pricing

Midtrans pricing

7.7 Revenue Composition

Return to related chapter

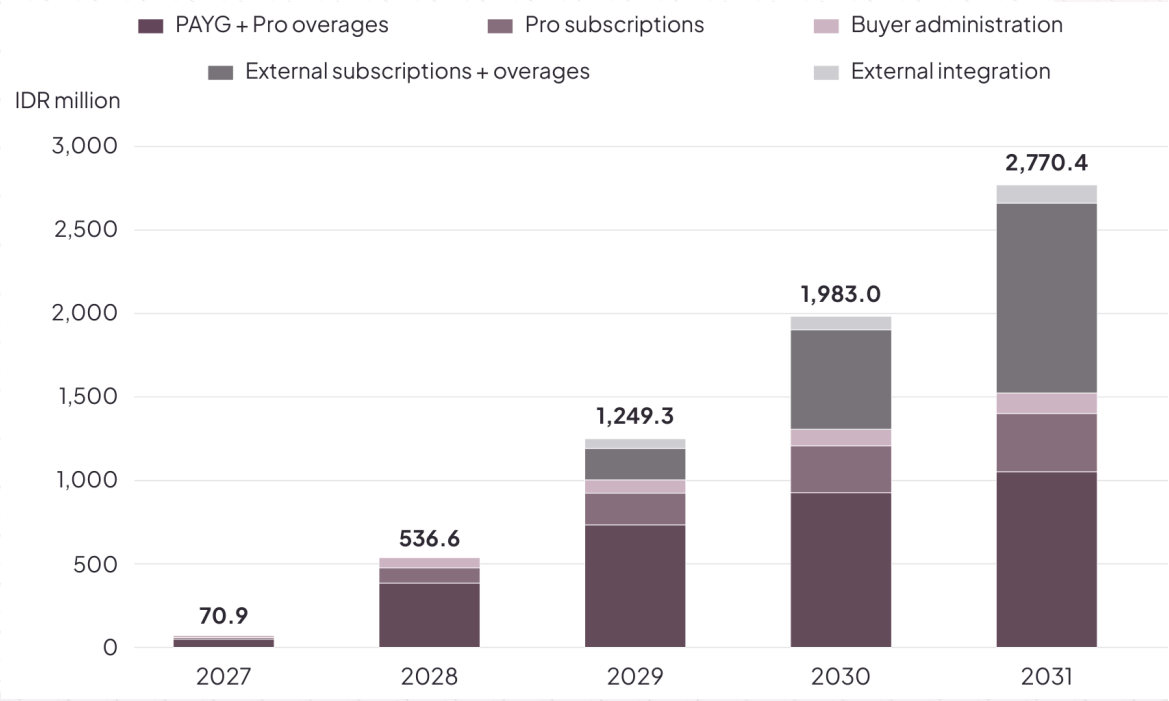

Figure 40. Base-case recognized revenue by stream from 2027 to 2031

Table 20. Recognized revenue by stream

IDR million	2027	2028	2029	2030	2031
PAYG and Pro overages	48.72	384.60	733.46	926.40	1,052.16
Pro subscriptions	8.98	91.11	190.38	281.22	348.96
Buyer administration	13.17	60.85	79.69	98.97	122.98
External subscriptions and overages	0.00	0.00	188.17	595.80	1,136.86
External integration	0.00	0.00	57.60	80.64	109.44

IDR million	2027	2028	2029	2030	2031
Total recognized revenue	70.87	536.57	1,249.29	1,983.03	2,770.40

IDR million. External income begins in 2029; included usage is not billed twice.

Appendix 8 Implementation Roadmap

Return to contents

8.1 Detailed Workstream Schedule

Return to related chapter

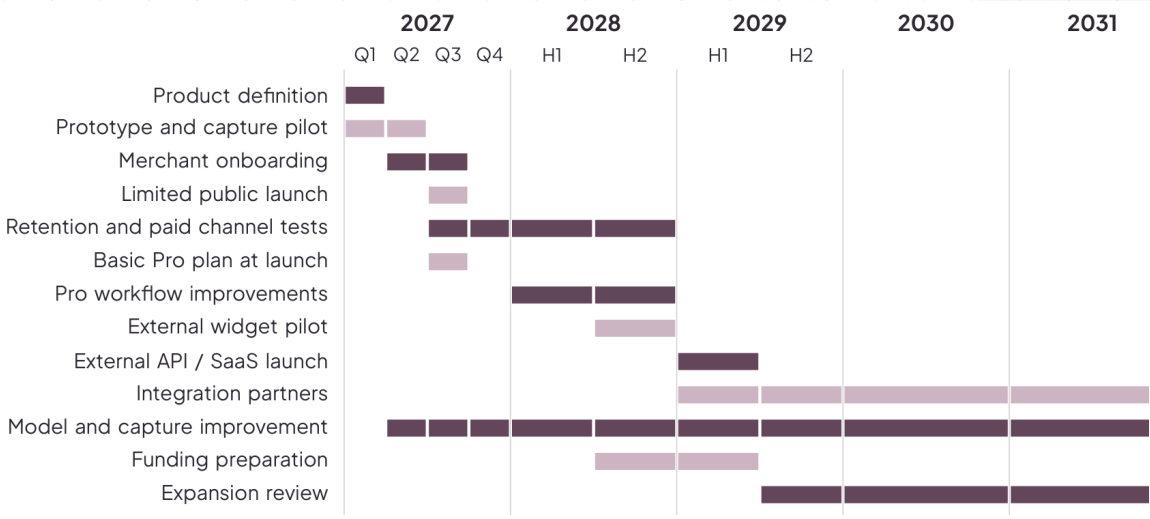

Figure 41. Detailed implementation schedule

The bars show planned activity from 2027 to 2031. Commercial launch and expansion retain the funding sequence described in Chapter 7.

8.2 Deliverables and Responsibilities

Return to related chapter

Period	Priority deliverable	Accountable role and completion criterion
2027 H1	Product definition, capture protocol and service preparation	Founders; narrow category, quality rules, support and payment routes ready
2027 Q3	Limited public launch and Basic Pro	Founders; paid publishing, included usage, overages and transaction flow reconciled
2027 Q4–2028	Retention review, merchant workflow improvements and channel development	Commercial founder; repeated publishing and acquisition cost recorded
2028	External widget preparation and trial	Product founder; separate account, access and integration requirements reviewed
Before January 2029	Expansion funding preparation	Founders; cash requirement, reserve policy and dilution case prepared
January 2029	External API/SaaS launch	Founders; paid external account and repeatable onboarding process

Period	Priority deliverable	Accountable role and completion criterion
2029–2031	Integration partners, capture improvement and expansion review	Founders; contribution, reliable capture and service capacity support each step

Appendix 9 Impact and Risk

Return to contents

9.1 Impact Measurement

Return to related chapter

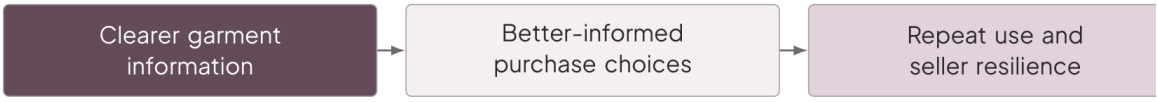

Figure 42. Intended customer and enterprise outcomes

Outcome	Measure	Interpretation limit
Merchant workflow	Minutes per accepted profile, recaptures and repeated customer questions	A decrease in time is a workflow result, not proof of higher sales
Buyer understanding	Reported clarity after comparison and property-related support questions	Optional responses require sample and response-rate disclosure
Expectations after purchase	Buyer-reported agreement between expected and received garment properties	Self-report does not establish material chemistry or exact touch
Continued garment use	Optional follow-up on use and resale of purchased garments	Follow-up attrition and reporting bias remain visible
Environmental outcome	Separate evidence on displaced purchases, garment life and service energy	No emissions savings are inferred from transactions alone

9.2 Commercial and Funding Risks

Return to related chapter

Risk	Trigger	Response and owner
Profile willingness to pay	Repeat paid use fails to justify merchant effort	Simplify workflow and review value across merchant channels; commercial founder
Weak retention	Seller churn exceeds selected case input	Investigate causes and correct recurring workflow problems; commercial founder
Paid acquisition subsidy	Contribution LTV/CAC below 1× or payback above 12 months	Review or pause the affected channel before increasing spend; founders
Cash shortfall	Cash below six-month fixed-cost reserve	Stage commitments and seek equity before expansion; founders
External substitution	Existing merchants move activity to external accounts	Separate cohorts and count marketplace migration losses; commercial founder

9.3 Service and Information Risks

Return to related chapter

Risk	Trigger	Response and owner
Capture quality	Incomplete or inconsistent required media	Guided recapture, retry cap and review queue; product founder
Fabric overclaim	Unsupported material statement or repeated disputed observation	Remove the claim, expose source evidence and restrict affected category; product founder
Usage overrun	Retries or compute time exceed per-job estimate	Meter jobs, enforce allowances and review capture causes; product founder
Private media exposure	Unnecessary access or retention of reference captures	Restrict access, apply retention/deletion controls and investigate incident; product founder
Execution capacity	Review or support workload exceeds available staff time	Narrow intake and stage contractor support; founders
Research transfer	Foreign review associations used as Indonesian demand evidence	Correct the claim and retain source geography and method limits; founders
